AIR

POLLUTION

INTRODUCTION

Air pollution is the Contamination of air due to the presence of substances in the atmosphere that are harmful to the health of humans and other living beings, or cause damage to the climate or to materials. There are many different types of air pollutants, such as gases (including ammonia, carbon monoxide, sulfur dioxide, nitrous oxides, methane, carbon dioxide and chlorofluorocarbons), and biological molecules. Air pollution can cause diseases, allergies, and even death to humans; it can also cause harm to other living organisms such as animals and food crops, and may damage the natural environment (for example, climate change, ozone depletion or habitat degradation) or built environment (for example, acid rain). Both human activity and natural processes can generate air pollution.

INTRODUCTION

HEALTH EFFECTS OF AIR POLLUTION

The infographic features a central illustration of a woman wearing a face mask, with a city skyline in the background. Below the title, six circular icons represent different health effects: a heart (cardiovascular), lungs (respiratory), a person coughing (asthma), a clock (time/chronic), an eye (eye irritation), and two drops of blood (blood-related). Below these icons is a color-coded AQI index scale: 0-50 (green), 51-100 (yellow), 101-150 (orange), 151-200 (red), 201-300 (dark red), and 301-500 (purple).

WHO IS MOST AFFECTED?

This section contains six icons representing vulnerable groups: a person with a cane, a person with a heart symbol, a pregnant woman, a person with a sun symbol, a person with a sun symbol, and a person with a heart symbol.

HOW TO PROTECT YOURSELF?

This section contains six icons representing protective measures: a mobile phone, a car, a person wearing a mask, a person wearing a mask, a person wearing a mask, and a person wearing a mask.

Understanding the health effects of air pollution is crucial for developing effective strategies to protect public health and the environment.

HEALTH EFFECTS

Even at levels lower than those considered safe by United States regulators, exposure to three components of air pollution, fine particulate matter, nitrogen dioxide and ozone, correlates with cardiac and respiratory illness. In 2020, pollution (including air pollution) was a contributing factor to one in eight deaths in Europe, and was a significant risk factor for pollution-related diseases including heart disease, stroke and lung cancer. The health effects caused by air pollution may include difficulty in breathing, wheezing, coughing, asthma and worsening of existing respiratory and cardiac conditions. These effects can result in increased medications use, increased doctor or emergency department visits, more hospital admissions and premature death. The human health effects of poor air quality are far reaching, but principally affect the body's respiratory system and the cardiovascular system. Individual reactions to air pollutants depend on the type of pollutant a person is exposed to, the degree of exposure, and the individual's health status and genetics.

HEALTH EFFECTS

AGRICULTURE EFFECTS

In India in 2014, it was reported that air pollution by black carbon and ground level ozone had reduced crop yields in the most affected areas by almost half in 2011 when compared to 1980 levels.

Developing means of farming and agriculture is the reason humans can live in the world today. It is a necessary means of survival, without which there would be famines all over the world. For thousands of years, agriculture was a natural process that did not harm the land it was done on. In fact, farmers were able to pass down their land for many generations, and it would still be fertile as ever. However, modern agricultural practices have started the process of causing the degradation of the ecosystem, land, and environment due to the modern day by-products of agriculture. Agriculture is a complex activity in which the growth of crops and livestock have to be balanced perfectly.

ECONOMY EFFECTS

Air pollution costs the world economy \$5 trillion per year as a result of productivity losses and degraded quality of life, according to a joint study by the World Bank and the Institute for Health Metrics and Evaluation (IHME) at the University of Washington. These productivity losses are caused by deaths due to diseases caused by air pollution. ~~and the problem~~ One out of ten deaths in 2013 was caused by diseases associated with air pollution and the problem is getting worse. The problem is even more acute in the developing world. "Children under age 5 in lower-income countries are more than 60 times as likely to die from exposure to air pollution as children in high-income countries". The report states that additional economic losses caused by air pollution, including health costs and the adverse effect on agricultural and other productivity were not calculated in the report, and thus the actual costs to the world economy are far higher than \$5 trillion.

OBJECTIVE

- 1) Our Objectives for doing this project is to express our disapproval of air pollution as it has been the biggest cause of global warming so far. Things like greenhouse gases and car exhaust are the most common causes for air pollution.
- 2) Although Singapore is not causing so much air pollution, there are countries like China which produces a lot of air pollution. [Most of the time Beijing is covered with haze and the air quality there is so bad that people are forced to wear a mask, to prevent themselves from inhaling the bad air.]
- 3) If we do not stop air pollution, the icecaps in the north pole will eventually melt and the sea level will rise, thus flooding the low lying countries. (Like Singapore!) → It will kill cute animals like polar bears. [Sad:]
- 4) All of us have a part to play! Air pollution is also destroying the ozone layer and lots of animals thus we want to reduce it.

5) we think that by doing a Campaign, we can warn people of the cons of air pollution and tell them what they can do to stop it.

DATA COLLECTION OF AIR POLLUTION IN OUR LOCALITY

AREA OF AIR POLLUTION	DEGREE OF AIR POLLUTION	SCALE IN CENTIMETRES
Main Road	90°	9 Cm
Play Ground	58°	5.8 Cm
Home	30°	3 Cm

CONCLUSION

OR

INTERFERENCE

- * Air pollution is a major environment issue. It can affect the health and life support systems as well. Since clear air is an essential factor of life for respiration, it is necessary to prevent the sources of air pollution.
- * Air pollution is often the most obvious and wide-spread type of pollution.
- * Health effects of these pollutants include respiratory diseases, birth defects, heart attacks, cancer, and developmental disabilities in children. Environment impacts include destruction of stratospheric ozone, poisoning of forests and waters by acid rain, and corrosion of building materials.

* we have made encouraging progress in controlling air pollution, progress that has economic benefits as well as health benefits.

ACKNOWLEDGEMENT

I express my special thanks to my principal Chhabi De Environmental Studies teacher ~~Mr.~~ Buddhadev Mallick, who always gave me guidance and helped me to know about the subject. I had made this project from my heart and shown utmost sincerity to complete it. I am very thankful to all those people who helped me and guided me to make such a project. I also thank my parents who have provided me all the resources required to make this project.

Anjali Yadav.
